TITLE OF THE INVENTION

SUBSTITUTED ARYL PIPERAZINES AS NEUROKININ ANTAGONISTS

5 BACKGROUND OF THE INVENTION

The invention disclosed herein is directed to certain substituted aryl piperazines useful as tachykinin receptor antagonists. In particular, the compounds disclosed herein are neurokinin receptor antagonists.

10 The tachykinins, substance P (SP), neurokinin A (NKA) and neurokinin B (NKB), are structurally similar members of a family of neuropeptides. Each of these is an agonist of the receptor types, neurokinin-1 receptor (NK-1), neurokinin-2 receptor (NK-2) and
15 neurokinin-3 receptor (NK-3), which are so defined according to their relative abilities to bind tachykinins with high affinity and to be activated by the natural agonists SP, NKA and NKB respectively.

 The neurokinin receptors are widely distributed throughout the mammalian nervous system (especially brain and spinal ganglia), the circulatory system and peripheral tissues (especially the duodenum and
20 jejunum) and are involved in regulating a number of diverse biological processes. This includes sensory perception of olfaction, vision, audition and pain, movement control, gastric motility, vasodilation, salivation, and micturition (B. Pernow, *Pharmacol. Rev.*, 1983, 35, 85-141). The NK1 and NK2 receptor subtypes are implicated in synaptic
25 transmission (Laneuville *et al.*, *Life Sci.*, 42: 1295-1305 (1988)).

 Substance P acts as a vasodilator, a depressant, stimulates salivation and produces increased capillary permeability. It is also capable of producing both analgesia and hyperalgesia in animals, depending on dose and pain responsiveness of the animal (see R.C.A. Frederickson *et al.*, *Science*, 199, 1359 (1978); P. Oehme *et al.*, *Science*,
30 208, 305 (1980)) and plays a role in sensory transmission and pain perception (T.M. Jessell, *Advan. Biochem. Psychopharmacol.* 28, 189 (1981)). In particular, substance P has been shown to be involved in the transmission of pain in migraine (see B.E.B. Sandberg *et al.*, *Journal of*

- 2 -

Medicinal Chemistry, 25, 1009 (1982)), and in arthritis (Levine *et al.*, *Science*, (1984) 226 547-549).

In the airways, it has been indicated that NK1 receptors are associated with microvascular leakage and mucus secretion, while NK2
5 receptors regulate smooth muscle contraction. Also, it has been shown that both substance P and neurokinin A are effective in inducing airway constriction and edema. Based on such findings, it is believed that substance P and neurokinin A may be involved in the pathogenesis of neurogenic inflammation, including allergic diseases such as asthma.
10 (Frossard *et al.*, *Life Sci.*, 49, 1941-1953 (1991); Advenier, *et al.*, *Biochem. Biophys. Res. Comm.*, 184(3), 1418-1424 (1992)).

In experimental studies, sensory neuropeptides, especially tachykinins such as substance P and neurokinin A, can bring about many of the pathophysiological features of asthma. Neurokinin A is a very
15 potent constrictor of human airways *in vitro*, and substance P causes mucus secretion in the airways. (Barnes P.J., *Lancet*, pp 242-44 (1986); Rogers D.R., Aursudkij B., Barnes P.J., *Euro. J. Pharmacol*, 174, 283-86 (1989)).

Inhalation of bradykinin causes bronchoconstriction in
20 asthmatic patients but not in normal subjects. (Fuller R.W., Dixon C.M.S., Cuss F.M.C., Barnes P.J., *Am Rev Respir Dis*, 135, 176-80 (1987)). Since the bradykinin-induced bronchoconstriction is partly opposed by anticholinergic agents and since bradykinin is only a weak constrictor of human airways *in vitro*, it has been suggested that the
25 bronchoconstrictor response is partly mediated by a neural reflex. Bradykinin stimulates vagal afferent C fibers and causes bronchoconstriction in dogs. (Kaufman M.P., Coleridge H.M., Coleridge J.C.G., Baker D.G., *J. Appl. Physio.*, 48, 511-17 (1980)). In guinea-pig airways, bradykinin causes a bronchoconstrictor response by
30 way of cholinergic and sensory-nerve-mediated mechanisms. (Ichinoe M., Belvisi M.G., Barnes P.J., *J. Pharmacol. Exp. Ther.*, 253, 594-99 (1990). Bradykinin-induced bronchoconstriction in human airways may therefore be due partly to tachykinin released from sensory nerve terminals via axon reflex mechanisms. Clinical trials have shown that a

- 3 -

dual NK-1/NK-2 antagonist (such as FK-224) protects against bradykinin induced bronchoconstriction in asthmatic patients. (Ichinoe, M. *et al.*, *Lancet*, vol. 340, pp 1248-1251 (1992)).

The tachykinins have also been implicated in
5 gastrointestinal (GI) disorders and diseases of the GI tract, such as inflammatory bowel disease, ulcerative colitis and Crohn's disease, etc. (see Mantyh *et al.*, *Neuroscience*, 25 (3), 817-37 (1988) and D. Regoli in *Trends in Cluster Headache* Ed. F. Sicuteri *et al.*, Elsevier Scientific Publishers, Amsterdam, 1987, pp. 85-95).

10 It is also hypothesized that there is a neurogenic mechanism for arthritis in which substance P may play a role (Kidd *et al.*, "A Neurogenic Mechanism for Symmetric Arthritis" in *The Lancet*, 11 November 1989 and Gronblad *et al.*, "Neuropeptides in Synovium of Patients with Rheumatoid Arthritis and Osteoarthritis" in *J. Rheumatol.*
15 (1988) 15(12) 1807-10). Therefore, substance P is believed to be involved in the inflammatory response in diseases such as rheumatoid arthritis and osteoarthritis (O'Byrne *et al.*, in *Arthritis and Rheumatism* (1990) 33 1023-8). Other disease areas where tachykinin antagonists are believed to be useful are allergic conditions (Hamelet *et al.*, *Can. J.*
20 *Pharmacol. Physiol.* (1988) 66 1361-7), immunoregulation (Lotz *et al.*, *Science* (1988) 241 1218-21, Kimball *et al.*, *J. Immunol.* (1988) 141 (10) 3564-9 and A. Perianin, *et al.*, *Biochem. Biophys. Res. Commun.* 161, 520 (1989)) vasodilation, bronchospasm, reflex or neuronal control of the viscera (Mantyh *et al.*, *PNAS* (1988) 85 3235-9) and,
25 possibly by arresting or slowing β -amyloid-mediated neurodegenerative changes (Yankner *et al.*, *Science*, (1990) 250, 279-82) in senile dementia of the Alzheimer type, Alzheimer's disease and Downs Syndrome. Substance P may also play a role in demyelinating diseases such as multiple sclerosis and amyotrophic lateral sclerosis (J. Lubner-Narod
30 *et al.*, poster presented at C.I.N.P. XVIIIth Congress, 28th June-2nd July, 1992). Antagonists selective for the substance P and/or the neurokinin A receptor may be useful in the treatment of asthmatic disease (Frossard *et al.*, *Life Sci.*, 49, 1941-1953 (1991); Advenier, *et al.*, *Biochem. Biophys. Res. Comm.*, 184(3), 1418-1424 (1992)). These

- 4 -

antagonists may also be useful in the treatment of emesis. See C. Bountra, K. Bounce, T. Dale, C. Gardner, C. Jordan, D. Twissell and P. Ward, *Eur. J. Pharmacol.*, 249, R3-R4 (1993) "Anti-emetic profile of a non-peptide neurokinin NK1 receptor antagonist", CP-99,994, in the

In a third alternative embodiment the compounds of
Formula I can be co-administered with a leucotriene antagonist, such a
leucotriene D₄ antagonist, exemplified by those disclosed in EP O
480,717, published April 15, 1992; US 5,270,324, issued December 14,
30 1993; EP O 604,114, published June 1994; and US 4,859,692, issued
August 22, 1989. This combination is particularly useful in the
treatment of respiratory diseases such as asthma, chronic bronchitis and
cough.

- 30 -

In a fourth embodiment the compounds of Formula I may be used in combination with a aerosolized corticosteroid such as Kenalog, Aristocort, Nasalide, Preferid, Benecorten or others such as disclosed in U.S. 2,789,118, U.S. 2,990,401, 3,048,581, U.S. 3,126,375,
5 U.S. 3,929,768, U.S. 3,996,359, U.S. 3,928,326 and 3,749,712.

The compounds of Formula I are useful in the prevention and treatment of a wide variety of clinical conditions (as detailed in this specification) which are characterized by overstimulation of the tachykinin receptors, in particular NK1, NK2 and NK3.

10 These conditions may include disorders of the central nervous system such as anxiety, depression, psychosis and schizophrenia; neurodegenerative disorders such as AIDS related dementia, senile dementia of the Alzheimer type, Alzheimer's disease
15 and Down's syndrome; demyelinating diseases such as multiple sclerosis and amyotrophic lateral sclerosis and other neuropathological disorders such as diabetic or peripheral neuropathy, AIDS related neuropathy, chemotherapy-induced neuropathy, and neuralgia; respiratory diseases
20 such as chronic obstructive airways disease, bronchopneumonia, bronchospasm and asthma; inflammatory diseases such as inflammatory bowel disease, psoriasis, fibrositis, osteoarthritis and rheumatoid arthritis; allergies such as eczema and rhinitis; hypersensitivity
25 disorders such as poison ivy; ophthalmic diseases such as conjunctivitis, vernal conjunctivitis, and the like; cutaneous diseases such as contact dermatitis, atopic dermatitis, urticaria, and other eczematoid dermatitis; addiction disorders such as alcoholism; stress related somatic disorders; reflex sympathetic dystrophy such as shoulder/hand syndrome; dysthymic disorders; adverse immunological reactions such as rejection of transplanted tissues and disorders related to immune enhancement or suppression such as systemic lupus erythematosus; gastrointestinal (GI)
30 disorders and diseases of the GI tract such as disorders associated with the neuronal control of viscera such as ulcerative colitis, Crohn's disease, irritable bowel syndrome, incontinence, nausea, and emesis, including acute, delayed, post-operative, late-phase, and anticipatory emesis, such as emesis induced by for example chemotherapy, radiation,

- 31 -

surgery, migraine, toxins, such as metabolic or microbial toxins, viral or bacterial infections, pregnancy, vestibular disorder, motion, mechanical stimulation, psychological stress or disturbance, high altitude, weightlessness, intoxication, resulting for example from consumption of alcohol, and variations in intracranial pressure, in particular, for example, drug or radiation induced emesis or post-operative nausea and vomiting; disorders of bladder function; fibrosing and collagen diseases such as scleroderma and eosinophilic fasciitis; disorders of blood flow caused by vasodilation and vasospastic diseases such as angina, migraine and Reynaud's disease; and pain or nociception, for example, that is attributable to or associated with any of the foregoing conditions especially the transmission of pain in migraine. Hence, these compounds are readily adapted to therapeutic use for the treatment of physiological disorders associated with the overstimulation of the tachykinin receptors, in particular NK1, NK2 and NK3.

The compounds of the present invention are particularly useful in the treatment of pain or nociception and/or inflammation and disorders associated therewith such as, for example: neuropathy, such as diabetic or peripheral neuropathy and chemotherapy-induced neuropathy; asthma; osteoarthritis; rheumatoid arthritis; and migraine.

For the treatment of any of these diseases compounds of Formula I may be administered orally, topically, parenterally, ICV, by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intracisternal injection or infusion techniques. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats, etc., the compounds of the invention are effective in the treatment of humans.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according

- 32 -

to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide

5 pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium

10 phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the

15 gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in the US Patents 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for

20 control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed

25 with water or an oil medium, for example, peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example,

30 sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, for example, polyoxyethylene stearate,

- 33 -

or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethylene-oxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or

- 5 condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example, polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example, ethyl, or n-propyl, p-hydroxybenzoate, one
10 or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example, arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin.

- The oily suspensions may contain a thickening agent, for example,
15 beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

- Dispersible powders and granules suitable for preparation
20 of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening,
25 flavoring and coloring agents, may also be present.

- The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for example, liquid paraffin or mixtures of these. Suitable emulsifying
30 agents may be naturally-occurring gums, for example, gum acacia or gum tragacanth, naturally-occurring phosphatides, for example, soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example,

- 34 -

polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example, glycerol, propylene glycol, sorbitol or sucrose.

5 Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which
10 have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In
15 addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The compounds of Formula I may also be administered in
20 the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

25 For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the compounds of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.)

In the treatment of a condition associated with an excess of
30 tachykinins, an appropriate dosage level will generally be about 0.001 to 50 mg per kg patient body weight per day which can be administered in single or multiple doses. Preferably, the dosage level will be about 0.01 to about 25 mg/kg per day; more preferably about 0.05 to about 10 mg/kg per day. A suitable dosage level may be about 0.001 to 25 mg/kg

- 35 -

per day, about 0.005 to 10 mg/kg per day, or about 0.005 to 5 mg/kg per day. Within this range the dosage may be 0.005 to 0.05, 0.05 to 0.5 or 0.5 to 5.0 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

5

TACHYKININ ANTAGONISM ASSAY

The compounds of this invention are useful for antagonizing tachykinins, in particular substance P and neurokinin A in the treatment of gastrointestinal disorders, central nervous system disorders, inflammatory diseases, pain or migraine and asthma in a mammal in need of such treatment. This activity can be demonstrated by the following assay.

15 A. Receptor Expression in COS

To express the cloned human neurokinin-1 receptor (NK1R) transiently in COS, the cDNA for the human NK1R was cloned into the expression vector pCDM9 which was derived from pCDM8 (INVITROGEN) by inserting the ampicillin resistance gene (nucleotide 1973 to 2964 from BLUESCRIPT SK+) into the Sac II site. Transfection of 20 µg of the plasmid DNA into 10 million COS cells was achieved by electroporation in 800 µl of transfection buffer (135 mM NaCl, 1.2 mM CaCl₂, 1.2 mM MgCl₂, 2.4 mM K₂HPO₄, 0.6 mM KH₂PO₄, 10 mM glucose, 10 mM HEPES pH 7.4) at 260 V and 950 uF using the IBI GENEZAPPER (IBI, New Haven, CT). The cells were incubated in 10% fetal calf serum, 2 mM glutamine, 100U/ml penicillin-streptomycin, and 90% DMEM media (GIBCO, Grand Island, NY) in 5% CO₂ at 37°C for three days before the binding assay. Similar methods were used to express the NK2 receptor.

30

B. Stable Expression in CHO

To establish a stable cell line expressing the cloned human NK1R, the cDNA was subcloned into the vector pRcCMV (INVITROGEN). Transfection of 20 µg of the plasmid DNA into CHO

- 36 -

cells was achieved by electroporation in 800 μ l of transfection buffer supplemented with 0.625 mg/ml Herring sperm DNA at 300 V and 950 uF using the IBI GENEZAPPER (IBI). The transfected cells were incubated in CHO media (10% fetal calf serum, 100 U/ml penicillin-streptomycin, 2 mM glutamine, 1/500 hypoxanthine-thymidine (ATCC), 90% IMDM media (JRH BIOSCIENCES, Lenexa, KS), 0.7 mg/ml G418 (GIBCO)) in 5% CO₂ at 37°C until colonies were visible. Each colony was separated and propagated. The cell clone with the highest number of human NK1R was selected for subsequent applications such as drug screening.

Similar methods were used to express the human NK2 receptor.

C. Assay Protocol using COS or CHO

The binding assay of human NK1R expressed in either COS or CHO cells is based on the use of ¹²⁵I-substance P (¹²⁵I-SP, from DU PONT, Boston, MA) as a radioactively labeled ligand which competes with unlabeled substance P or any other ligand for binding to the human NK1R. Monolayer cell cultures of COS or CHO were dissociated by the non-enzymatic solution (SPECIALTY MEDIA, Lavallette, NJ) and resuspended in appropriate volume of the binding buffer (50 mM Tris pH 7.5, 5 mM MnCl₂, 150 mM NaCl, 0.04 mg/ml bacitracin, 0.004 mg/ml leupeptin, 0.02 mg/ml BSA, 0.01 mM phosphoramidon) such that 200 μ l of the cell suspension would give rise to about 10,000 cpm of specific ¹²⁵I-SP binding (approximately 50,000 to 200,000 cells). In the binding assay, 500 μ l of cells were added to a tube containing 20 μ l of 1.5 to 0.25 nM of ¹²⁵I-SP and 5 μ l of unlabeled substance p or any other test compound in DMSO. The tubes were incubated at 4°C or at room temperature for 1 hour with gentle shaking. The bound radioactivity was separated from unbound radioactivity by GF/C filter (BRANDEL, Gaithersburg, MD) which was pre-wetted with 0.1% polyethylenimine. The filter was washed with 3 ml of wash buffer (50 mM Tris pH 7.5, 5 mM MnCl₂, 150 mM NaCl) three times and its radioactivity was determined by gamma counter. A

- 37 -

similar assay was used for NK2 except ^{125}I -NKA was used as the ligand.

- The activation of phospholipase C by NK1R may also be measured in CHO cells expressing the human NK1R by determining the accumulation of inositol monophosphate which is a degradation product of IP₃. CHO cells are seeded in 12-well plate at 250,000 cells per well. After incubating in CHO media for 4 days, cells are loaded with 0.025 $\mu\text{Ci}/\text{ml}$ of ^3H -myoinositol by overnight incubation. The extracellular radioactivity is removed by washing with phosphate buffered saline.
- 10 LiCl is added to the well at final concentration of 0.1 mM with or without the test compound, and incubation is continued at 37°C for 15 min. Substance P is added to the well at final concentration of 0.3 nM to activate the human NK1R. After 30 min of incubation at 37°C, the media is removed and 0.1 N HCl is added. Each well is sonicated at 4°C
- 15 and extracted with CHCl_3 /methanol (1:1). The aqueous phase is applied to a 1 ml Dowex AG 1X8 ion exchange column. The column is washed with 0.1 N formic acid followed by 0.025 M ammonium formate-0.1 N formic acid. The inositol monophosphate is eluted with 0.2 M ammonium formate-0.1 N formic acid and quantitated by beta counter.
- 20 similar methods were used to assess antagonism at the NK2 receptor, except NKA was used as the stimulating agonist.

- The compounds of Formula I as Exemplified in the EXAMPLES below have been found to displace radioactive ligand for the NK-1 receptor at a concentration range of 0.01 nM to 1.0 μM , for
- 25 the NK-2 receptor, 0.01 nM to 5 μM , and for the NK-3 receptor, 1.0 nM to 10 μM . For comparison the activity of FK-224 is disclosed in Ichinoe, M. *et al.*, *Lancet*, vol. 340, pp 1248-1251 (1992).

- Several methods for preparing the compounds of this invention are illustrated in the following Schemes and Examples. Starting materials are made from known procedures or as illustrated. Substituted purines may be prepared as disclosed in US 5,057,517; imidazo(1,2-a)pyrazinyl, as disclosed in US 4,242,344; (1,2,4)-triazolo(1,5-a)pyrazinyl as disclosed in *J. Org. Chem.*, **1974**, 39, 2143 and *J.C.S. Perkin I*, **1980**, 506; 1,7-naphthyridinyl as disclosed in *J. Org. Chem.* **1963**, 28, 1753; furo(3,2-c)pyridinyl as disclosed in *J. Heterocyclic Chem.*, **1982**, 19, 1207; and substituted 6-H-7,8-dihydro-thiopyrano(3,2-d)pyrimidyl as disclosed in *Arch. Int. Pharmacodyn.* **1986**, 280, pp302-313. As appreciated by those of skill in the art, compounds bearing the substituents R₈ and R₉ may be prepared essentially as described in the Schemes.

The compounds of the present invention are prepared by alkylating piperazine 1 (R₁ = H) under appropriate conditions (Scheme 1). In one method illustrated by Example 1, Step E, piperazine 1 (R₁ = H) is combined with the appropriate aldehyde and the intermediate imine is reduced to the amine chemically (e.g. using sodium cyanoborohydride) or catalytically (e.g. using hydrogen and palladium on carbon or Raney nickel catalyst) (Scheme 1). The aldehyde needed

- 41 -

for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention the preparation of a representative aldehyde is described in Examples 1 Step A by Hale, J.J.; Finke, P.E.; MacCoss, M. *Bioorganic and Medicinal*

5 *Chemistry Letters* 1993 3, 319-322.

In an alternative embodiment of the present invention, piperazine 1 ($R_1 = H$) can be alkylated with an alkyl halide or alkyl sulfonate ester (with or without an added base to neutralize the mineral acid or sulfonic acid by-product) to give the desired compound (Scheme 1). The alkyl halide or alkyl sulfonate needed for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention an aldehyde, prepared as described above, can be reduced to an alcohol with sodium borohydride, diisobutylaluminum hydride or lithium aluminum hydride, and the product alcohol converted to either the alkyl halide using methods described in March J., *Advanced Organic Chemistry*, 3rd ed., John Wiley & Sons, New York, pp. 382-384 (1985), or alkyl sulfonate ester using methods described in March J., *Advanced Organic Chemistry*, 3rd ed., John Wiley & Sons, New York, p. 444 (1985).

20 In an alternative embodiment of the present invention, 1 ($R_1 = H$) can be acylated to give the tertiary amide and subsequent reduction with a strong reducing agent (e.g. diborane including borane dimethylsulfide; and, lithium aluminum hydride) will give the desired compound (Scheme 1). The acylating agent needed for this reaction can be prepared by methods generally known in the chemical literature; for the purposes of the present invention an aldehyde, prepared as described above, can be oxidized using such commonly used reagents as permanganate in acid or silver oxide, and the resulting acid activated as an acid chloride or mixed anhydride which can be used to acylate I.

25 The product amide can in and of itself be a neurokinin antagonist or can be reduced with a strong reducing agent, such as diborane or lithium aluminum hydride, to give the tertiary amine.

- 42 -

SCHEME I

- 5 Optionally, Compound 1 formed in the alkylation step may be further modified in subsequent reactions. In one illustration of such an approach, the piperazine fragment may contain a nitro group, which is reduced to the amine after the coupling step. The resulting amine is further modified by acylation to provide the desired compounds. The
- 10 piperazine fragment may also contain a protecting group such as a benzyl ester or a t-butyl ester. After reductive amination the protecting group is removed and the resulting acid is further reacted to provide additional analogs. Alternatively, the aldehyde portion may also contain a protecting group such as a t-butoxycarbonyl for an amino function.
- 15 After reductive amination, the t-butoxycarbonyl group is removed by treatment with a strong acid such as trifluoroacetic acid, formic acid or

- 43 -

hydrochloric acid and the resulting amine may be acylated to provide other analogs.

The piperazine starting materials used in the coupling reaction are prepared using methods described in the literature; more specifically as described in Meurer, US 5,057,517; US 4,242,344; *J. Org. Chem.*, 1974, 39, 2143 and *J.C.S. Perkin I*, 1980, 506; *J. Org. Chem.* 1963, 28, 1753; *J. Heterocyclic Chem.*, 1982, 19, 1207; *Arch. Int. Pharmacodyn.* 1986, 280, pp302-313 ; Meurer, L.. C. *et al.*, *J. Med. Chem.*, 1992, 35, 3845-3857. None of these published compounds are claimed to be neurokinin antagonists. Alternatively, the piperazine substrates can be prepared as illustrated in Schemes 2-4.

Substituted 4-arylpiperazines can be prepared from appropriate fluorobenzene derivative as shown in Scheme 2. Thus, reaction of 2-fluorobenzonitrile with 1-t-butoxycarbonylpiperazine in the presence of a base such as K₂CO₃ gives 1-t-butoxycarbonyl-4-(2-cyanophenyl)-piperazine. Reduction of the cyano group by hydrogenation in the presence of Raney nickel or by other known methods gives a benzyl amine which can be acylated (Example 1, Step D). The t-butoxycarbonyl protecting group is removed by treatment with trifluoroacetic acid or anhydrous HCl to give a piperazine which can be used in the reductive amination step (Example 1, Step E). Similar reactions using 2-chloro-nitrobenzene in the place of 2-fluorobenzonitrile can provide compounds containing a substituted aniline. Analogs containing a benzoic acid or its derivatives can be prepared by substituting 2-fluorobenzoic acid in this sequence.

- 44 -

SCHEME 2

- 5 Arylpiperazine derivatives containing heterocyclic substituents can be synthesized as shown in Scheme 3. Reaction between 2-fluorobenzaldehyde and 1-t-butoxycarbonylpiperazine as described above gives 1-t-butoxycarbonyl-4-(2-formylphenyl)-piperazine (Example 9, Step A). Reduction of the aldehyde and treatment of the
- 10 resulting alcohol with methanesulfonyl chloride gives a mesylate, while treatment of the alcohol with triphenylphosphine and carbon tetrabromide gives the bromide. Displacement of the mesylate by a heterocycle such as imidazole (Example 9, Step C) in the presence of a base and removal of the t-butoxycarbonyl protecting group furnishes
- 15 piperazine which is used in the coupling reactions described in Scheme I.

- 45 -

SCHEME 3

- 5 Preparation of piperazines containing a heteroaryl substituent is outlined in Scheme 4. Reaction of 1-t-butoxycarbonyl-piperazine with a chloro substituted heteroaromatic compound such as 8-chloro-1,7-naphthyridine (Example 22, Step A) or 8-chloro-(1,2,4)-
- 10 triazolo(1,5-a)pyrazine (Example 23, Step A) gives a protected piperazine. Removal of the t-butoxycarbonyl protecting group by treatment with acid provides the piperazine substrate for use in the coupling step.

- 46 -

SCHEME 4

- 5 Preparation of hydroxymethyl derivatives of the target compounds is outlined in Scheme 5. The oxazolidinone imide is made from the indicated acid, by formation of the corresponding acid chloride (by treatment with oxalyl chloride or thionyl chloride) and addition of N-lithio 2(S)-benzyl oxazolidinone. The enolate azidation
- 10 can be accomplished by a variety of methods, such as the procedure of Evans, D. A.; et. al. *J. Am. Chem. Soc.* **1990**, *112*, 4011-4030. Reduction of the oxazolidinone moiety can be carried out by a variety of metal hydride reagents (e.g. $\text{LiBH}_4/\text{MeOH}$, LiAlH_4 , etc.). The azide is then reduced by treatment with $\text{PPh}_3/\text{H}_2\text{O}$ or NaBH_4 . Formation of
- 15 the cyclic carbamate is accomplished by literature methods; i.e. phosgene, triphosgene or carbonyl diimidazole. The target compounds are prepared by oxidative cleavage of the olefin to the aldehyde followed by reductive amination with an amine salt as described for Scheme 1. In one method illustrated by Example 48, the aldehyde is
- 20 reductively aminated with a heteroaryl substituted aryl piperazine to afford the target precursors. Hydrolysis of the cyclic carbamate under basic conditions (for example, potassium hydroxide in ethanol at elevated temperature) followed by selective amide formation at 0°C by combining with an active acylating agent derived from an aryl

- 47 -

carboxylic acid (for example, an aroyl chloride) gives the α -hydroxymethyl amides.

- 48 -

SCHEME 5

- 49 -

Preparation of piperazines containing a heteroaryl substituent on a branched side chain is outlined in Scheme 6. Reaction of the 2-piperazinyl-benzaldehyde derivative whose synthesis is described in Scheme 3 with a carbon nucleophile such as a Grignard reagent, for example methyl magnesium bromide, provides the corresponding benzylic alcohol. Conversion to the benzylic amine can be carried out by treatment of the alcohol with potassium phthalimide in the presence of diethyl azodicarboxylate and triphenyl phosphine, to provide the benzylic N-phthalimido derivative. Heating with hydrazine hydrate then gives the free primary amine. Conversion to the corresponding benzylic amine can also be carried out by activation of the hydroxyl group with a alkyl- or arylsulfonyl chloride, such as p-toluenesulfonyl chloride, to give a benzylic sulfonate ester. The sulfonate ester is then displaced with ammonia or a primary or secondary amine. Alternatively, the sulfonate ester can be displaced with a suitable salt of the azide anion, such as sodium azide, zinc azide, or tetrabutylammonium azide, and the resulting alkyl azide can be reduced to the primary amine with hydrogen gas in the presence of a suitable catalyst, such as 5% palladium on carbon. Alternatively, the alkyl azide can be reduced by treatment with triphenyl phosphine followed by hydrolysis to provide the primary amine.

The benzylic amine can then be derivatized with a number of electrophilic reagents, such as alkyl or aryl sulfonyl chlorides, carboxylic acid chlorides, carboxylic acid anhydrides, alkyl chloroformates, carbamyl chlorides or alkyl or aryl isocyanates to provide sulfonamides, carboxamides, ureas, or carbamates. These intermediates can then be deprotected under acidic conditions to remove the Boc group to provide the free piperazines for use in the coupling reactions described in Scheme I.

EXAMPLE 1

1-(3-((S)-(3,4-Dichlorophenyl))-4-(N-3,5-dimethylbenzoyl)-(methyl-amino))butyl)-4-((2-acetylaminomethyl)phenyl)-piperazine

5

Step A: 3-((S)-(3,4-Dichlorophenyl))-4-((3,5-dimethylbenzoyl)methyl-amino)-butanal

10 To a suspension of 4.81 g (32 mmol) of 3,5-dimethylbenzoic acid in 30 mL of CH₂Cl₂ and 7 drops of DMF was added 3.3 mL (38 mmol) of oxalyl chloride. After stirring for 1 h all the solids were dissolved and gas evolution had stopped. The solution was concentrated and the residual acid chloride was dissolved in 20 mL of CH₂Cl₂. This solution was added to a solution of 7.2 g (29 mmol) of 3-
15 (S)-(3,4-dichlorophenyl)-4-methylamino-1-pentene (prepared as described by J. Hale *et al.*, *Bioorganic and Medicinal Chemistry Letters*, 1993, 3, 319-322) in 50 mL of CH₂Cl₂ and 5.3 mL (38 mmol) of triethylamine (Et₃N) with cooling in an ice bath. The ice bath was removed after 5 min and stirring was continued for 1 h. The reaction
20 mixture was diluted with CH₂Cl₂ and washed with water, 1.2 N HCl, saturated NaHCO₃ and brine. The solution was dried over Na₂SO₄ and concentrated to give 11.98 g of residual oil.

1H NMR (CDCl₃, ppm ranges are given because of amide rotamers and
25 line broadening) 2.26 (s, 6 H), 2.1-3.9 (m, 8 H), 4.9-5.1 (m, 2 H), 5.4-5.7 (m, 1 H), 6.5 -7.4 (m, 6 H).

The residue was dissolved in 45 mL of acetone, 15 mL of t-butanol and 15 mL of water. To this solution 0.75 mL of osmium
30 tetroxide (4% solution in water) and 3.63 g (31 mmol) of 4-methylmorpholine N-oxide were added. After stirring for 18 h, the reaction was quenched with approximately 30 mL of 10% aqueous Na₂SO₃ and concentrated to 25% of the original volume. The residue was partitioned between water and 1:1 ether (Et₂O), ethyl acetate

- 52 -

(EtOAc), the layers were separated and the aqueous layer was reextracted with Et₂O:EtOAc. Each organic layer was washed with water, brine and dried by filtering through Na₂SO₄. The combined filtrate was concentrated to afford the crude diol.

5 A solution of the diol in 60 mL of tetrahydrofuran (THF) and 20 mL of water was treated with 6.63 g (31 mmol) of sodium periodate. After stirring for 2 h, the reaction was diluted with Et₂O:EtOAc and washed with water and brine. The organic layer was dried (Na₂SO₄) and the filtrate was concentrated. The residue was
10 purified by prep LC using 30% EtOAc/hexane to furnish 7.86 g (72% yield for three steps) of the title compound as a light yellow solid.

1H NMR (CDCl₃, ppm ranges are given because of amide rotamers and line broadening) δ 2.27 (s, 6 H), 2.6-3.9 (m, 8 H), 6.5-7.5 (m, 6 H),
15 9.73 (s, 1 H).

Step B: 1-t-Butoxycarbonyl-4-(2-cyano)phenyl-piperazine

To a 30ml DMF solution of t-butylpiperazine carboxylate 10g
20 (53.7mmol) and o-fluorobenzonitrile 4.34g (35.8mmol) were added potassium carbonate 22.26 g (161 mmol) and copper powder 230mg (3.6mmol). The reaction mixture was stirred at 150 °C in an oil bath overnight. After cooling to rt, the reaction mixture was concentrated reduced pressure. The residual material was suspended in EtOAc and
25 was filtered through a pad of celite. The filtrate was washed with sat NH₄Cl aq. solution, dried over anhydrous Na₂SO₄, filtered, concentrated, chromatographed on silica gel column eluting with Hexanes : EtOAc = 10:1 to 7:1 to give 7.84g of the title compound.

30 1H-NMR (400MHz CDCl₃) δ 1.46(9H,s), 3.13(4H, m), 3.61(4H, m), 6.99-7.04(2H, s), 7.46-7.58(2H,s).

Step C: 1-t-Butoxycarbonyl-4-(2-aminomethyl)phenyl-piperazine

- 53 -

1-t-Butoxycarbonyl-4-(2-cyano)phenyl-piperazine 3g (10.4mmol) was dissolved in EtOH (65ml) and liq. NH₃ (13ml), and was hydrogenated in a bomb (H₂ 1000psi, 80° C, 36hr). The solvent was then removed under reduced pressure to give the title compound. This material was used in step D below without further purification.

Step D: 4-(2-(Acetylaminoethyl)phenyl)-piperazine

A solution of 0.258 g (0.89 mmol) of 4-(2-aminomethyl)-phenyl-1-t-butoxycarbonylpiperazine (from Step C above) in 3 mL of CH₂Cl₂ was treated with 0.075 mL (1.06 mmol) of acetyl chloride and 0.15 mL (1.07 mmol) of Et₃N. After stirring for 20 min the reaction mixture was diluted with CH₂Cl₂ and washed with water, saturated NaHCO₃, brine and dried over Na₂SO₄. The filtrate was concentrated and the residue was treated with 10 drops of anisole and 2 mL of cold TFA. The solution was stirred in an ice bath for 1 hr, then concentrated. The residue was partitioned between CH₂Cl₂ and dilute NaOH. The organic layer was washed with brine, dried and the filtrate was concentrated to furnish 0.198 g (96%) of the title compound which was used in the next step without purification.

¹H NMR (CDCl₃) δ 2.0 (s, 3 H), 2.90 (m, 4 H), 3.02 (m, 4 H), 4.52 (AB, 2 H), 6.55 (br s, 1 H), 6.85-7.4 (m, 4 H).

Step E: 1-(3-((S)-(3,4-Dichlorophenyl))-4-(N-3,5-dimethylbenzoyl)-(methyl-amino))butyl)-4-(2-(acetylaminoethyl)phenyl)-piperazine

To a solution of 0.12 g (0.32 mmol) of 3-((S)-(3,4-dichlorophenyl))-4-((3,5-dimethylbenzoyl)methylamino)butanal (Step A) in 1 mL of MeOH were added 0.099 g (0.42 mmol) of 4-(2-acetylaminoethyl)phenyl-piperazine (Step D), 0.3 g of powdered 4 Å molecular sieves and 20 uL of acetic acid. After stirring the mixture for 1.5 h a solution of 0.063 g (1 mmol) of NaCNBH₃ in 3 mL of THF was added. Some gas evolution was observed. After 1 h when the reaction was complete by TLC the mixture was filtered through a pad

- 54 -

of celite, the reaction flask and the pad were rinsed with MeOH. The filtrate was concentrated to approximately 2 mL and the residue was diluted with Et₂O:EtOAc. The Et₂O:EtOAc solution was washed with water, brine and dried over Na₂SO₄. The filtrate was concentrated and the residue was purified by prep TLC using 88:10:2 EtOAc:MeOH:Et₃N to isolate 0.163 g (86%) of the title compound as a white foam.

¹H NMR (CDCl₃, ppm ranges are given because of amide rotamers and line broadening) δ 1.98 (s, 3 H), 1.5-3.9 (m, 18 H), 2.27 (s, 6 H), 4.48 (AB, 2 H), 6.3-6.5 (br, 1 H), 6.6-7.5 (m, 10 H).

The reaction was stirred at r.t. for 16 h and was then partitioned between ethyl ether and water. The organic layer was washed with brine, dried (Na_2SO_4) and concentrated. The residue was flash chromatographed with a solvent gradient of 25-40% EtOAc/Hexanes to give 2.6 g (89% from Step A) of oil which solidified on standing.

Following the procedure described in Example 1 step A, 3-((S)-
25 (3,4-dichlorophenyl))-4-((N-3,5-bis-
trifluoromethylbenzoyl)methylamino)-butanal was prepared using 3,5-

Step B: 1-t-Butoxycarbonyl-4-(2-bromomethyl)phenyl)-piperazine

- 75 -

To 410mg (1.4mmol) of 1-t-butoxycarbonyl-4-(2-hydroxymethyl)phenyl)-piperazine (prepared in Example 9, Step B) in 12 mL of acetonitrile was added 625 mg (2.38mmol) of triphenylphosphine and 698mg (2.1mmol) of carbon tetrabromide with cooling in an ice-water bath. After the mixture was stirred in a cold room (4°C) for 14hr, the solvent was removed under reduced pressure. The resulting oil was dissolved in EtOAc and water was then added. The phases were separated and the aqueous phase was extracted with two small portions of EtOAc. The combined organic phases were dried over anhydrous Na₂SO₄, filtered, concentrated, and triturated with hexane. The triphenylphosphine oxide which precipitated was removed by filtration. The filtrate was concentrated to give the title compound, which was used in step C without further purification.

After stirring for 10min, 9ml of the DMF solution of 1-t-butoxycarbonyl-4-(2-bromomethyl)phenyl)-piperazine prepared in step B was added, and the mixture was stirred in an oil bath at 70° C for 1.5hr. The DMF was then removed under reduced pressure. The resulting material was dissolved in EtOAc and sat. NH₄Cl aq. solution. The organic phase was separated and the aqueous phase was extracted twice with small portions of EtOAc. The combined organic phases were dried over anhydrous Na₂SO₄, filtered, concentrated, and chromatographed on silica gel eluting with Hexane : EtOAc = 5 : 1 to 1 : 1 to give 144.3mg of 1-t-

15 Step A: Diazomethyl-(2-(S)-(3,4-dichlorophenyl)-pent-4-enyl)-ketone.

To a solution of 2-(S)-(3,4-dichlorophenyl)-pent-4-enoic acid (5.04g, 20.6mmol) in 60mL of dichloromethane was added 2.15mL (24.6mmol) of oxalyl chloride and 0.1mL of dimethylformamide with
20 cooling in an ice-water bath. The cooling bath was then removed and the reaction mixture was stirred at rt overnight. The solvent was removed under reduced pressure, and the resulting material was diluted in ethyl acetate and concentrated in vacuo in order to remove residual HCl. The residual crude acid chloride was dissolved in 70mL of ether
25 and was slowly added to a 100mL ether solution of diazomethane (77mmol). After stirring for 2hr at rt, the solvent was removed under vacuum. The resulting yellow oil was chromatographed on silica gel column eluting with a gradient of hexane : ethyl acetate = 20 : 1 to 3 : 1 to give 4.66g (84%) of diazomethyl-(2-(S)-(3,4-dichlorophenyl)-pent-4-enyl)-ketone.

tetrahydrofuran was removed under reduced pressure. The remaining
aqueous layer was extracted with two 100mL portions of
10 dichloromethane. The combined organic phases were washed with
brine, dried over anhydrous magnesium sulfate, filtered, and
concentrated. The resulting material was purified by silica gel column

was stirred 1 h in a 30°C water bath, whereupon it was diluted with
H₂O (50 mL) and extracted with CH₂Cl₂ (3 x 30 mL). The combined
30 organic extracts were washed with sat. aq. NaHCO₃, brine, dried

7-Chloro-triazolo(2,3-a)pyrimidine (*Chem. Pharm. Bull.*, 1959, 7, 907) (1.01g, 6.54mmol), was suspended in isoamyl alcohol (25mL) and 1-(t-butyloxycarbonyl)piperazine (4.86g, 26.13mmol) was added. This solution (dissolution occurred readily upon warming) was heated under reflux, under nitrogen for 1hr and then the reaction mixture was cooled, evaporated to dryness and the residue was dissolved in CH₂Cl₂ (100mL) and 10% aq. Na₂CO₃ (100mL). After shaking, the layers were separated and the organic layer was washed with 10% aq. Na₂CO₃ (2 x 100mL) and the pooled organic layers were dried (over MgSO₄), filtered, and evaporated to dryness. This oily residue was dissolved in a little CH₂Cl₂, absorbed onto silica gel 60, and applied to a silica gel 60 column (3.5 x 22.0 cm), packed and developed in CH₂Cl₂. Fractions containing the required product were pooled and evaporated to dryness to give a white solid which was crystallized from CH₂Cl₂/Et₂O to give 1.47g of the title compound as a white crystalline solid. Yield 1.71g (5.63mmol, 86% yield) in two crops.

a)pyrimidine prepared as described in step A (0.301g, 0.99mmol), was dissolved in anhydrous HCO_2H (10mL) and allowed to stand at room temperature for 1 $\frac{1}{2}$ hr and then was evaporated to dryness *in vacuo*. The column was developed with H_2O and fractions containing the required product were pooled and evaporated to dryness to give 0.21g. TLC indicated a small amount of starting material remaining and the residue was then dissolved in CF_3CO_2H (10mL) and allowed to stand at room temperature for 45 min. The reaction was then evaporated to dryness slowly under a nitrogen stream and the residue was evaporated to dryness once from H_2O before being dissolved in a little H_2O and passed down a Dowex 1 x 2 (OH-form) column (2 x 25cm) as before. Fractions containing the required product were pooled and evaporated to dryness to give the title compound as a white solid (0.21g, quantitative yield) in the free base form.

TLC indicated a small amount of starting material remaining and the residue was then dissolved in CF₃CO₂H (10 mL) and allowed to stand at room temperature for 45 min. The reaction was then evaporated to dryness slowly under a nitrogen stream and the residue was evaporated to dryness once from H₂O before being dissolved in a little H₂O and passed down a Dowex 1 x 2 (OH⁻ form) column (2 x 25 cm) as before. Fractions containing the required product were pooled and evaporated to dryness to give the title compound as a white solid (0.21 g, quantitative yield), in the free base form.

EXAMPLE 61

1-(3-((S)-(3,4-Dichlorophenyl))-4-(N-3,5-bis-
 (trifluoromethyl)benzoyl(methylamino))butyl)-4-(2-(1-(R)-
 5 (methanesulfonylamino)ethyl)phenyl)-piperazine and
 1-(3-((S)-(3,4-Dichlorophenyl))-4-(N-3,5-bis-
 (trifluoromethyl)benzoyl(methylamino))butyl)-4-(2-(1-(S)-
 (methanesulfonylamino)ethyl)phenyl)-piperazine

10

Step A 1-t-butoxycarbonyl-4-(2-(1-(RS)-hydroxyethyl)phenyl)-
 piperazine

15

To a solution of 1g of 1-t-butoxycarbonyl-4-(2-formylphenyl)-
 piperazine (3.44mmol) (prepared as described in example 9 step A) in
 20 THF 30ml was added methylmagnesium bromide (3M THF solution)
 1.26ml (3.78mmol) with cooling in an ice-water bath. The cooling bath
 was then removed and the reaction mixture was stirred at rt for 1hr.
 The reaction was quenched by the addition of saturated NH₄Cl solution.

- 105 -

After removal of THF under reduced pressure, the reaction mixture was diluted with ethyl acetate and water. Organic phase was separated. The aqueous phase was extracted twice with ethyl acetate, and the combined org. phases were dried over anhydrous sodium sulfate, filtered, and concentrated. The residue was purified by flash chromatography on silica gel eluting with a hexanes/ethyl acetate mixture to give 919mg (87%) of the desired alcohol.

¹H-NMR (500MHz, CDCl₃): δ 1.51(s, 9H), 1.55(d, J=6.5Hz, 3H), 2.91-2.97(m, 4H), 3.4-3.8(br s, 4H), 5.1(br s, 1H), 5.8(br s, 1H). Mass spectrum (CI) m/z 307 (M⁺+1).

Step B 1-t-butoxycarbonyl-4-(2-(1-(RS)-aminoethyl)phenyl)-piperazine

To a solution of 1g of the alcohol obtained in step A (3.26mmol) in THF 10ml was added 1.03g (3.93mmol) of triphenylphosphine and 624mg (4.24mmol) of phthalimide, and finally 0.565ml (3.44mmol) of diethylazodicarboxylate with cooling in an ice-water bath. The cooling bath was then removed and the reaction mixture was stirred at rt overnight. THF was removed under reduced pressure. The remaining material was diluted with ethyl acetate and water, and the organic phase was separated. The aqueous phase was extracted twice with ethyl acetate. The combined organic phases were dried over anhydrous sodium sulfate, filtered, concentrated, and the residue was purified by flash chromatography on silica gel eluting with 10:1 to 3:1 hexanes/ethyl acetate to give 1.13g (79%) of the desired compound.

- 106 -

¹H-NMR (500MHz, CDCl₃): δ1.5 & 1.55 (s, 9H), 1.82(d, 3H), 2.7-2.82(br s, 4H), 3.2-4.0(br s, 4H), 6.1(m, 1H), 7.1-7.8(m, 8H).

To a solution of 1.13g (2.6mmol) of the compound obtained above dissolved in 25 mL of absolute ethanol was added 0.8ml (26mmol) of hydrazine hydrate and the reaction mixture was heated to reflux for 1.5hr. The voluminous precipitate of phthalimide was removed by filtration through a pad of celite. The filtrate was concentrated to give 750mg (95%) of the desired amine. This material was pure enough to be used in the next step.

¹H-NMR (500MHz, CDCl₃): δ1.41(d, J=6.7Hz, 3H), 1.51(s, 9H), 2.85-2.87(br s, 4H), 4.6(q, J=6.7Hz, 1H), 7.1-7.5(m, 4H).

Step C 1-t-butoxycarbonyl-4-(2-(1-(RS)-(methanesulfonylamino)ethyl)phenyl)-piperazine

This compound was synthesized following the procedure described in example 38 step A.

¹H-NMR (500MHz, CDCl₃): δ1.51(s, 9H), 1.54(d, J=7Hz, 3H), 2.75(s, 3H), 2.8-3.0(br s, 4H), 3.3-3.9(br s, 4H), 5.05(m, 1H), 5.85(br s, 1H), 7.2-7.4(m, 4H). Mass spectrum (CI) m/z 284 (M⁺+1).

Mass spectrum: (CI) m/z 755(³⁷Cl+³⁵Cl), 753 (³⁵Cl₂).

- 10 The compounds in example 62 -70 were prepared by reacting the requisite piperazine with either 3-((S)-3,4-dichlorophenyl))-4-((3,5-bistrifluoromethylbenzoyl)methylamino)butanal (Example 33 step A) or 3-((S)-3,4-dichlorophenyl))-4-((3-fluoro-5-trifluoromethylbenzoyl)methylamino)butanal (Example 45 step A), or
- 15 3-((S)-4-chlorophenyl))-4-((3,5-bistrifluoromethylbenzoyl)methylamino)butanal (example 30) according to the procedure of Example 1, step E. The piperazine substrates were synthesized by the method of example 61 step C by substituting the appropriate acylation agent. In each case diastereomeric mixtures were
- 20 obtained.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
6-13 and 1-5,14-20 (in part)

Remark on Protest

☐

The additional search fees were accompanied by the applicant's protest.

☐

No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

I. Claims 6-13, and 1-5 (in part), 14-20 (in part), and are directed to compounds where Ar is phenyl or naphthyl.

II. Claims 1-5 (in part) and 14-30 (in part) are directed to compounds where Ar is heterocyclic.

Pursuant to PCT Rules 13.1 and 13.2 the compounds of Group II are properly separate from those of Group I since they are structurally different, made from different compounds, and do not suggest each other.
